

GH20VT SERIES (Stainless Steel)

Conoflow's Vacuum Regulators are designed to accurately regulate the sub-atmospheric pressure of a vessel being evacuated. These units are especially suited for laboratory work and test stands for simulation of high altitude conditions.

PRINCIPLES OF OPERATION

These units are used to provide a regulated vacuum. Turning the handwheel changes the force exerted by the range spring on the diaphragm assembly. Additional forces are exerted on the diaphragm assembly at atmospheric pressure underneath the top diaphragm and the regulated vacuum above it. Equilibrium is reached when all three of these forces are in balance. The forces from the lower diaphragm are negligible due to its reduced effective area. If the regulated vacuum drops below the set point, there is a net downward force on the diaphragm assembly which causes the nozzle to open. This allows the vacuum pump to increase the vacuum in the control chamber and in the regulator bonnet. As the vacuum increases, the upward force on the diaphragm assembly increases. This causes the diaphragm assembly to move upward allowing the nozzle to close. In equilibrium, the nozzle assumes a position to provide the required flow while maintaining the vacuum at the set point. If the regulated vacuum rises above the set point, the resulting upward force on the diaphragm assembly causes the diaphragm seat to lift off of the plug. This allows air at atmospheric pressure to enter the lower diaphragm decreasing the vacuum rises above the set point, the resulting upward force on the diaphragm assembly causes the diaphragm seat to lift off of the plug. This allows air at atmospheric pressure to enter the lower diaphragm assembly causes the diaphragm seat to lift off of the plug. This allows air at atmospheric pressure to enter the lower diaphragm decreasing the vacuum until the set point is reached.

Standard Specifications

Connections:

1/4" NPT w / 1/8" NPT Vacuum Sensing Port

Regulated Vacuum:

0-15" and 30" Hg (38.1 and 76.2 cm Hg)

Flow Capacity (Max.):

1.5 SCFM (0.04 m3/min)

Sensitivity:

0.2" H₂O (0.51 cm)

Ambient Temperature Range:

-20°F to +150°F (-29°C to +66°C) (w/Buna Diaphragm)

Approximate Shipping Weight:

3 lbs. (1.4 Kg)

Materials of Construction

Body:

316 Stainless Steel

Bonnet:

316 Stainless Steel

Diaphragm Assembly:

Teflon / Buna "N" / Teflon

Nozzle Assembly:

302 / 303 Stainless Steel

Range Spring:

316 Stainless Steel

Dimensional Drawing A17-5 is available upon request.

GH20VT SERIES (Stainless Steel)

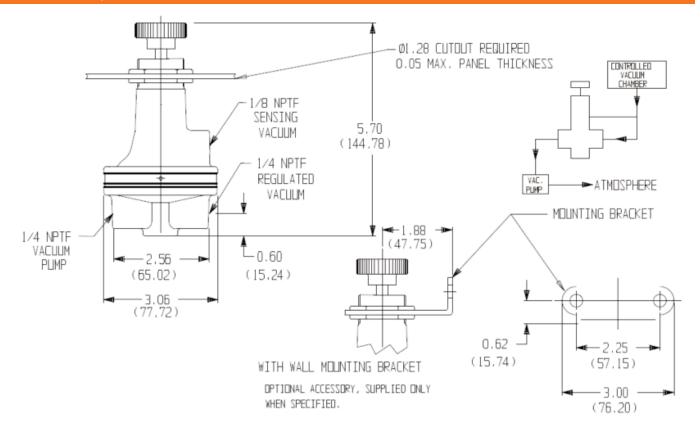

PRODUCT CONFIGURATION CODING

Product configuration coding is intended to provide a single source from which one can determine, in detail, the full scope of the product line. In addition to materials of construction, diaphragm selection and filtering capabilities, it also provides all necessary data, regarding adjustment options and range selections. Control Engineering Data also provides a means of communicating, by way of a code number, which is fully descriptive of the product selection.

NOTE: 1. Catalog numbers as received must contain ten (12) characters.
